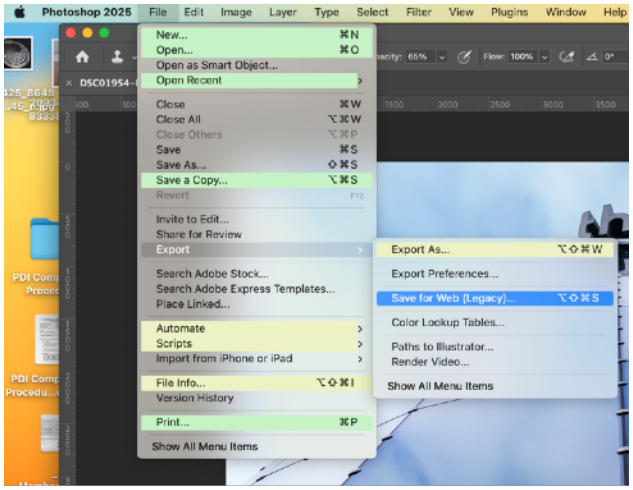
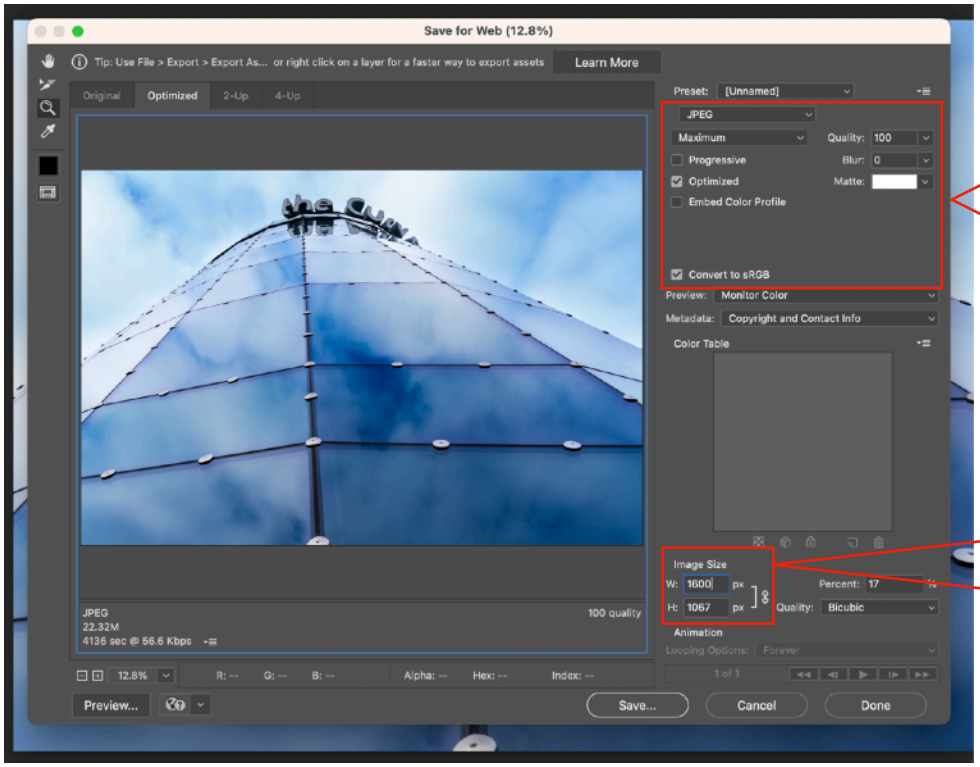
Preparing images for JPC PDI entries

Photoshop

The easiest way to prepare an image in Photoshop is to use the ”save for web tool”





JPEG
Maximum
Quality 100

Tick Convert to sRGB

Set width to 1600 px for an image in landscape orientation

Set height to 1200 px for an image in portrait orientation

Notes

sRGB may also referred to as IEC61966-2.1 - it’s the same

In the above example the image is in landscape orientation so I have set the width to 1600px the height will automatically be set.

If the image was in portrait orientation I would set the Height to 1200px and the width would automatically be set.
